Section 6 – Proposed Marijuana Concentrates and Marijuana Products

Review the requirements under 3 AAC 306.520, 3 AAC 306.525, and 3 AAC 306.560.
Attach a completed copy of this page for each proposed marijuana concentrate or marijuana product.

Product Name:	Live Resin		
Product Type:	Marijuana Concentrate (Smokable/Wholesale/In-House)		
Perishable: Yes/No	No	**Shelf Life:** If perishable.	

Product Description: Details must include the color, shape, and texture.	Live Resin has a crumbly, granular texture and can range in color from a light yellow to dark golden yellow.
Ingredients: This box is not applicable to marijuana concentrates.	N/A
Standard Production Procedure and Detailed Manufacturing Process:	Live Resin is created using a closed loop extraction machine and various post processing equipment with specific parameters set for Live Resin. Frozen marijuana material is loaded manually into a stainless steel vessel and pressurized solvent is passed through material to remove the cannabinoids, terpenes, plant waxes, and other volatile organic compounds. The output from extraction will need different post processing if any depending on the solvent used. Actual solvent used will be indicated on the final product label. See attached for additional production procedures and solvents used.
Depiction: Provide a photograph, drawing, or graphic representation of the expected appearance of the final product.

Section 7 – Proposed Product Packaging and Sample Labels

Review the requirements under 3 AAC 306.520, 3 AAC 306.565, and 3 AAC 306.570.
Attach a completed copy of this page for each proposed marijuana concentrate or marijuana product.

Product Name:	Live Resin
Product Type:	Marijuana Concentrate (Smokable/Wholesale/In-House)

Packaging Description:
Details must include the color(s), size, packaging materials used, total amount of THC, individual serving sizes (if multiple), and other specifics showing compliance with 3 AAC 306.565. Please include photos, drawings, or graphic representations.

Up to 7 grams of Live Resin will be packaged into non-stick, silicone, acrylic, plastic or glass containers with a lid. The small container will then be packaged into a mylar bag, box, or Blister Package. The product's complete packaging will be resealable and child-resistant. Retailers will ensure that purchases are in opaque exit bags. The total THC content will range from 20-99% with the actual THC content and solvent use will be listed on the label per the testing results.
Up to five (5) pounds of Live Resin will be stored in sanitized food-grade containers for wholesale sales and In-House use with their respective labels and test results.

Sample Labels:
Provide sample labels showing how the labeling requirements set forth in 3 AAC 306.570 will be met.

Live Resin

Additional Production Procedures

Hydrocarbon:
Using parameters designed for Live Resin ground marijuana material will be placed into the extraction tube of the Hydrocarbon extractor. A pressurized solvent tank passes approved hydrocarbon solvents (Butane, N-Butane, Iso-Butane, Propane and/or Ethanol) through the plant material to strip its' trichomes and a full range of cannabis compounds. The produced materials will then go through post extraction process using a vacuum oven, various vessels, and agitation/sieving tools to completely remove the residual solvent from the final product and achieve desired consistency. Product is then stored in a chilled area.

CO2:
Using parameters designed for Live Resin ground marijuana material is loaded manually into the extraction tube of the CO2 extractor, which is then pressurized. CO2 passes through the material and carries out the cannabinoids, terpenes, plant waxes, and other volatile organic compounds. Pressures and temperatures
can be varied to target specific compounds. The vessel is then de-pressurized, the plant
material is disposed of and the concentrate is removed from its collection Vessel separated by grade of specific compounds and stored in a chilled area
